

Tattava Copilot — AI-Native Product Strategy

Strategy Version: 1.0 | September 2026

Source basis: Attached *Tattava Copilot Business Requirements Document v1.0*, dated September 25, 2026, plus the prior Tattava discovery work available in this project context. The BRD explicitly positions V1 as the immediate priority and describes Tattava as a foundation for a longer-term entertainment operating system.

Strategy thesis:

Tattava should not compete primarily as another AI writing or AI filmmaking tool. Its strategic opportunity is to become the persistent intelligence layer for an entertainment project — starting with story development and progressively connecting creative decisions to visual development, production, localization, and distribution.

1. Executive Summary

1.1 Strategic opportunity

The BRD identifies a fundamental workflow problem: film development and production are fragmented across people, documents, tools, and stages. As a project moves from idea → research → story → screenplay → production, context and decisions can become disconnected. Tattava is intended to address this through a continuous **Project Intelligence Layer**.

The product therefore has two layers of value:

Immediate value — V1

Help creative teams move from:

Idea → Research → Story → Screenplay → Dialogue → Evaluated Story Package

faster and with greater continuity.

Long-term value

Create a persistent intelligence layer that can connect:

Idea → Story → Visual World → Production → Post → Localization → Distribution

The BRD explicitly defines this longer journey and says that V1 must establish the foundation for subsequent stages.

1.2 Strategic positioning

Do not define Tattava as:

| "An AI tool for writing scripts."

Strategic positioning

| **Tattava is an AI-native project intelligence and creative development operating system for entertainment teams.**

For V1:

| **Tattava helps writers, story developers, directors and creative producers transform an idea into a researched, structured, coherent and production-oriented story package while preserving human creative control.**

2. Product Vision

2.1 Vision

The product vision as an AI-native operating system for film development and production that transforms ideas into structured, production-ready projects while keeping creative teams in control.

Refined strategic vision

Build the intelligence layer behind entertainment creation — where every project remembers its story, research, characters, decisions, creative intent and dependencies, and AI helps teams continuously turn that intelligence into better creative and production outcomes.

This creates an important distinction:

Traditional software stores project information.

Tattava should understand project information and reason over it.

3. The Strategic Problem

The product should solve five connected problems.

Problem	Current consequence	Tattava opportunity
Fragmented project context	Information lives across documents, people and tools	Persistent Project Intelligence
Repetitive creative-development work	Research, structuring and transformations consume time	AI-assisted workflows
Weak continuity	Characters, decisions and facts can drift	Story Brain + Canon
Low research traceability	Creative decisions may lack evidence/provenance	Research Agent + source tracking
Creative → production disconnect	Story information has to be manually translated downstream	Structured project intelligence

The first four are directly reflected in the BRD's problem statement and objectives.

The fifth becomes especially important as Tattava expands toward production planning and the DVS Production Suite.

4. What Makes Tattava Genuinely AI-Native?

This should be one of the most important strategic definitions in the product.

An AI-enabled product adds AI to an existing workflow.

An **AI-native product** changes the workflow around intelligence.

Tattava's AI-native characteristics

1. Persistent project memory

The **Story Brain** is not merely a database.

It should represent:

- premise
- characters
- relationships
- world
- research
- decisions
- narrative structure
- canon
- creative direction
- project history

The Story Brain as the persistent project-intelligence core of V1.

2. AI reasons over project state

Instead of:

┆ "Write a scene about X."

Tattava should understand:

┆ "Write the next scene using the approved character motivation, the established world rules, the research findings and the current narrative structure."

That is fundamentally different from generic prompting.

3. Multi-agent workflow

V1 already defines a chain:

Input → Story Brain → Research → Character Intelligence → Narrative Reasoning → Story Development → Format/Genre → Template → Writing → Screenplay → Dialogue → Story Doctor → Canon/Continuity → Evaluation

The strategic implication is:

The unit of intelligence is the project, not the prompt.

4. AI generates + critiques + validates

Tattava should not only generate.

It should:

Understand → Research → Generate → Reason → Check → Explain → Ask → Revise → Validate

The BRD already includes Narrative Reasoning, Story Doctor, Canon & Continuity and Evaluation.

5. Human-controlled autonomy

The product principle is explicitly human-in-the-loop: AI assists creative professionals but does not independently make irreversible creative decisions.

Therefore:

Tattava should optimize for human decision velocity, not AI autonomy for its own sake.

5. Strategic Product Model

A useful way to think about Tattava is:

```
graph TD; TATTVA --> PROJECT_INTELLIGENCE[PROJECT INTELLIGENCE]
```

This is the strategic foundation for V1 → V4 → Layer 2 → MVV OS.

6. Goals & KPI Framework

The BRD currently defines release-specific success metrics, including idea-to-story-package time, research turnaround, development iterations, adoption and repetitive-work savings for V1.

The strategy should turn those into a KPI hierarchy.

North Star Metric

Time to Production-Ready Project

Long term:

Reduce the time and operational complexity required to move an entertainment idea from concept to production-ready execution while preserving human creative control.

This directly follows the BRD's North Star.

For V1, use a narrower proxy:

Time from Idea → Approved Story Development Package

Goal 1 — Accelerate creative development

KPI type	Metric
North-star proxy	Idea → approved story package time
Leading	Time to first useful AI-assisted artifact
Leading	Research turnaround
Leading	Time per development iteration
Outcome	Development hours saved
Outcome	Number of projects developed per period

Goal 2 — Improve project intelligence and continuity

KPI	Definition
Canon consistency	% of generated content consistent with approved canon
Context reuse	% of downstream outputs using existing project context
Contradiction detection	Issues detected before downstream approval
Continuity incidents	Contradictions found after approval
Project memory utilization	Projects actively using Story Brain

The BRD specifically identifies continuity and persistent project context as core objectives.

Goal 3 — Improve research quality and trust

AI-specific metrics

- Source attribution coverage
- Citation correctness

- Research-grounded response rate
- Unsupported-claim rate
- User correction rate
- Research acceptance rate
- Source traceability

The BRD requires research to prioritize credible and traceable sources and retain source, reference, finding and relevance information.

Goal 4 — Drive creative-team adoption

Avoid measuring adoption simply as "number of AI generations."

Measure:

- Projects created
- Projects returning for multiple sessions
- Percentage of projects reaching Story Brain activation
- Percentage reaching approved story output
- Repeat usage by creative teams
- Human approval rate
- User-reported time saved
- Workflow completion rate

Critical metric

% of projects that reach a human-approved milestone

This prevents the product from optimizing for AI activity instead of real creative progress.

Goal 5 — Improve production readiness

V1 should create structured information that later becomes useful downstream.

Measure:

- Story package completeness
- Character completeness
- Research completeness
- Canon completeness
- Screenplay completeness
- Structured metadata completeness
- Downstream reuse of V1 information

This directly supports the BRD objective of converting creative development into structured information that can support real production planning.

7. Market & Competitive Analysis

7.1 Market structure

The current market appears to be forming around several overlapping categories:

A. Creative development / screenwriting

Examples include Celtx and other writing-oriented platforms.

B. Production management

StudioBinder, Yamdu, Celtx and Filmustage address script breakdown, scheduling, production planning and related workflows.

C. AI visual storytelling

Boords and LTX Studio connect scripts/ideas with storyboards and visual development.

D. Generative creative platforms

Runway and Adobe Firefly are moving toward multi-step creative workflows and multi-model generation.

This fragmentation is strategically important.

8. Competitive Landscape

Platform	Documented focus	Strategic implication for Tattava
Celtx	Writing, story development, breakdown, scheduling, cast/crew, budgeting, production	Demonstrates demand for connected film workflow software
StudioBinder	Script breakdown, stripboards, schedules, reports, production management	Strong production workflow precedent
Filmustage	AI breakdown, scheduling, call sheets, VFX analysis and production planning	AI is already entering production intelligence
Yamdu	Production management and centralized production information	Demonstrates value of a production "single source of truth"
Boords	AI storyboards, script-to-storyboard, visual continuity and collaboration	Shows value of persistent visual/project context
LTX Studio	Script/idea → storyboard → scenes → video → pitch deck	Directly overlaps with future visual/AI-filmmaking direction
Runway	Generative media plus Agent for planning and producing creative projects	Demonstrates movement from generation toward agentic creative workflows
Adobe Firefly	Multi-model creative generation and governed creative workflows	Shows importance of model-agnostic orchestration

Celtx currently describes an integrated workflow from writing/story development through pre-production and production, including breakdown, scheduling, cast/crew and budgeting. ([Celtx](#))

StudioBinder focuses on script breakdown, scheduling, stripboards, reports and production workflows. ([StudioBinder](#))

Filmustage now combines AI script breakdown with scheduling, call sheets and AI-powered VFX analysis. ([Filmustage Help](#))

Yamdu positions itself around centralized media production management and a single source of truth across production workflows. ([Yamdu](#))

Boords and **LTX Studio** demonstrate the movement toward AI-assisted storyboards and continuity-aware visual development. ([boords.com](#))

Runway Agent now describes a workflow where an agent can analyze an idea, plan a project, select models and generate multiple creative assets. ([Runway](#))

Adobe Firefly is also moving toward multi-model creative workflows, allowing enterprise users to access partner models inside governed workflows. ([Adobe Help Center](#))

Important caveat

These are **vendor-described capabilities**, not independent product-quality assessments.

9. The Strategic Whitespace

The whitespace should **not** be defined simply as:

| "All-in-one filmmaking software."

That space already contains strong workflow platforms.

The stronger hypothesis from the discovery work is:

| **Make the entertainment project itself the primary intelligence object.**

Instead of connecting applications:

Script → Scheduler → Storyboard → Production

Tattava should connect:

Intent → Decisions → Evidence → Story → Characters → Canon → Visuals → Production consequences

That distinction matters.

Existing model

Tools
↓
Documents
↓
People
↓
Manual handoffs

Tattava model

This is a **strategic hypothesis**, not yet a validated market moat.

It should be tested through interviews and workflow observation.

10. User Personas

The primary users as directors, writers, story developers, creative producers, showrunners and content development teams, with production, art and business roles as secondary users.

Based on that structure and the prior discovery work:

Persona 1 — Story Developer / Story Editor

Priority: P0

Job

Turn an idea or creative brief into a coherent narrative.

Needs

- research
- story exploration
- character development
- narrative structure
- continuity
- rapid iteration

Pain points

- research fragmentation
- repetitive synthesis
- managing multiple versions
- maintaining narrative consistency

AI expectation

AI should behave like a collaborative story-development partner rather than a blank chatbot.

Core JTBD

"Help me explore and develop a story without losing the logic, decisions and context I've already established."

11. Persona 2 — Writer / Screenwriter

Priority: P0

Job

Transform story concepts into structured narrative and screenplay.

Needs

- context-aware writing
- character consistency
- rewriting
- dialogue
- screenplay structure
- revision support

Critical trust requirement

The writer must remain the author.

AI should make suggestions and transformations, not silently overwrite creative intent.

The BRD explicitly requires review, modification and approval before progressing.

12. Persona 3 — Creative Producer

Priority: P0/P1

Job

Move multiple projects from concept toward approval and production.

Needs

- project visibility
- structured outputs
- research confidence
- development status
- creative options
- approval workflows

Core JTBD

"Help me understand whether this project is developing coherently and move it toward a decision-ready package."

13. Persona 4 — Director / Showrunner

Priority: P0/P1

Job

Maintain creative direction and make high-level narrative decisions.

Needs

- creative control
- alternatives
- story visualization
- character/world consistency
- fast iteration
- decision support

The product should **not** try to automate their creative authority.

14. Secondary Personas

Persona	Future value
Art Director	Story → visual world
Production Designer	Story → locations/assets
Producer	Story → production planning
Line Producer	Script → breakdown/schedule/budget
Casting	Characters → casting intelligence
Post-production	Project intelligence → post

Persona	Future value
Localization team	Canon → adapted versions
Business/Operations	Project → rights/costing/delivery

This aligns with the BRD's secondary and future user structure.

15. User Journey — Current State

Current creative development journey

```

Idea
↓
Discussion
↓
Google / Web Research
↓
Notes / Docs
↓
Story exploration
↓
Character development
↓
Writer drafts
↓
Feedback
↓
Revisions
↓
Screenplay
↓
More feedback
↓
Continuity checking
↓
Pitch / Presentation

```

Friction

- context scattered across tools
- repeated research
- repeated explanations to collaborators

- manual synthesis
- version confusion
- continuity checking
- research provenance
- difficult handoff between creative stages

These problems are consistent with the fragmentation and development-friction problem described in the BRD.

16. Future-State Tattava Journey

This closely follows the V1 workflow defined in the BRD.

17. Where AI Creates Real Value

Journey moment	Human	AI
Idea	Creative intent	Understands intent + identifies missing context
Research	Defines questions	Finds, synthesizes and cites evidence
Exploration	Chooses direction	Generates alternatives
Characters	Defines creative intent	Builds structured character intelligence
Story	Approves direction	Develops narrative options
Writing	Authors/edits	Drafts, rewrites and transforms
Screenplay	Reviews	Converts approved narrative into screenplay structure
Dialogue	Defines voice	Generates context-aware dialogue

Journey moment	Human	AI
Continuity	Makes final judgment	Detects contradictions
Evaluation	Decides readiness	Surfaces strengths, gaps and risks

The key principle:

AI performs cognitive work; humans retain creative authority.

18. Strategic Opportunities

Opportunity 1 — Project Intelligence Layer

This should become the foundational product asset.

Not:

"Chat history"

but a structured representation of:

- entities
- relationships
- decisions
- evidence
- versions
- dependencies
- approvals
- canon
- creative intent

Opportunity 2 — Research → Story Intelligence

Research should not end as a PDF.

A research finding should become usable project intelligence.

Example:

```
Research Finding
  ↓
Source
  ↓
Project relevance
  ↓
Story implication
  ↓
Character implication
  ↓
Narrative decision
```

This is much more strategically valuable than simply providing search results.

19. Opportunity 3 — Dependency Intelligence

This is potentially one of the strongest long-term differentiators.

Example:

| Character age changes from 35 → 40.

Tattava should eventually identify:

- biography impact
- relationship impact
- timeline impact
- dialogue impact
- screenplay scenes
- visual references

- casting implications
- production implications

That evolves Tattava from **content generation** into **project reasoning**.

20. Opportunity 4 — Creative Decision Memory

The system should remember:

| "Why did the team decide this?"

Not only:

| "What did the team decide?"

This could create a **Decision Log**:

Decision	Reason	Evidence	Approved by	Impact
Genre	Creative direction	Market/context research	Creative lead	Story
Character motivation	Narrative logic	Story development	Writer	Dialogue
Location	Story requirement	Research	Director	Production

This aligns with the BRD's traceability principle.

21. Opportunity 5 — Production Consequence Intelligence

Long-term:

| "If I change the story, what changes downstream?"

For example:

Add a night sequence

could affect:

- location
- lighting
- cast availability
- schedule
- equipment
- budget
- VFX
- production days

This is where the V1 Story Brain can become the foundation for the future DVS Production Suite and MVV OS.

22. Key Product / AI Principles

Principle 1 — Project over prompt

The system should understand the project before answering the user.

Principle 2 — Context over generation

Do not optimize for maximum content generation.

Optimize for:

| **correct content within project context.**

Principle 3 — Evidence before confidence

For factual research:

Source → Evidence → Finding → Relevance

not:

LLM → confident paragraph

Principle 4 — Human authority

AI proposes.

Human decides.

The BRD makes human decision-making a foundational product principle.

Principle 5 — Every important artifact should be traceable

Users should understand:

- where information came from
 - when it changed
 - why it changed
 - who approved it
 - what it affects
-

Principle 6 — Model agnostic

The BRD explicitly states that Tattava should remain model- and technology-agnostic where practical.

This is increasingly relevant because creative platforms such as Adobe Firefly are already integrating multiple external models into a single workflow, while Runway is building agentic model selection into creative production. ([Adobe Help Center](#))

Therefore:

Tattava's durable value should not be the underlying model. It should be the project intelligence, workflow and orchestration layer above models.

23. Strategic Priorities

Priority 1 — Establish the Story Brain

Build the underlying project intelligence model before maximizing surface-level AI features.

It should understand:

- Project
 - Story
 - Character
 - Relationship
 - Location
 - Scene
 - Research
 - Source
 - Decision
 - Canon
 - Version
 - Approval
 - Dependency
-

Priority 2 — Build the V1 Golden Workflow

The critical loop is:

**Idea → Story Brain → Research → Story Development → Writing →
Screenplay → Continuity → Evaluation → Approved Package**

The BRD itself identifies V1 as the immediate priority.

Priority 3 — Make Research a first-class intelligence system

Research should be:

discoverable + traceable + reusable + project-linked.

Priority 4 — Make continuity a product capability, not a QA feature

Continuity should operate throughout the workflow.

It should not be a final "check my script" button.

Priority 5 — Design for downstream intelligence from Day 1

Even though V2/V3/Layer 2 are not V1 delivery priorities, V1's data model should support future continuity.

The BRD explicitly says V1 should establish the foundation required for V2, V3, V4, Layer 2 and MVV OS.

24. What Tattava Should NOT Optimize For

Don't optimize for:

- Number of AI generations
- Number of prompts
- Number of words generated
- Maximum automation
- Replacing writers
- Building another generic chatbot
- Building another standalone image/video generator

- Building every production feature in V1

Optimize for:

Projects moving meaningfully forward.

That means:

Time saved + quality of decisions + continuity + trust + approved outputs.

25. Assumptions vs Hypotheses

This distinction is important because the current BRD contains strategic assumptions, not all of which have been empirically validated.

Supported by BRD

Statement	Status
Creative workflows are fragmented	BRD problem definition
Persistent project context is valuable	BRD product principle
Human creative control is required	BRD principle
Research should be traceable	BRD requirement
V1 should focus on Story Development	BRD roadmap
Tattava initially serves internal strategic needs	BRD business model
V1 should establish Project Intelligence	BRD architecture direction

The internal-first business model is explicitly stated in the BRD.

Hypotheses requiring validation

H1

Creative teams will prefer a persistent project intelligence system over a collection of AI tools.

H2

Story Brain will produce enough value to create repeated usage.

H3

Research traceability will materially increase user trust.

H4

Continuity intelligence will be a meaningful pain point worth paying for.

H5

Creative teams will change their existing workflow to use Tattava.

H6

The Project Intelligence Layer can become the bridge between creative development and production operations.

These should be tested through user interviews, workflow observation and prototype testing rather than treated as proven facts.

26. Strategic Risk Map

Risk	Strategic response
AI output quality	Evaluation + human approval
Hallucinated research	Traceable sources + citation validation
Creative resistance	Collaborative workflow, not replacement
Context becoming noisy	Structured project intelligence
Continuity failure	Canon + dependency model
Model commoditization	Model-agnostic architecture
Security/IP risk	Project isolation + access control
Too-large V1	Focus on golden workflow
Competition from AI video platforms	Own project intelligence rather than raw generation

The BRD already identifies technology, creative, continuity, adoption, production complexity, data/IP and localization risks.

27. Recommended Strategic Priorities — 12-Month Logic

Phase 1 — Prove the intelligence layer

Goal:

Prove that Tattava understands a project better than a collection of ChatGPT + Google + Word workflows.

Focus:

- Project creation
 - Story Brain
 - Research Agent
 - Character Intelligence
 - Narrative Reasoning
 - Story Development
 - Writer interface
 - Canon
 - Evaluation
-

Phase 2 — Prove cross-stage intelligence

Connect:

Story → Screenplay → Characters → Story World → Visual

The goal is not merely adding visual generation.

The goal is proving:

| Information created once becomes intelligence everywhere.

Phase 3 — Prove production consequences

Connect:

Story → Breakdown → Production Planning → Schedule → Budget

This tests the larger Project Intelligence thesis.

Phase 4 — Expand into AI-native production

Only after the intelligence layer has sufficient quality:

Story World → Shot → Visual → Video → Edit → QC

This follows the BRD's V1 → V2 → V3 progression.

28. Final Strategic Narrative

The entire strategy can be reduced to this:

Film development is not primarily a content-generation problem. It is an intelligence, continuity and decision problem.

Writers, directors, producers and creative teams continuously make decisions.

Those decisions generate:

- stories
- characters
- research
- scenes
- scripts
- visuals
- production requirements
- budgets
- schedules
- versions

Today, much of this intelligence becomes fragmented across tools and people.

Tattava's strategic role

Capture the intelligence of the project once, understand it continuously, and make it useful at every subsequent stage.

That leads to the core product equation:

And the long-term strategic evolution becomes:

AI Assistant → AI Creative Copilot → AI Project Intelligence Layer → AI Production Operating System

The BRD itself defines this three-level evolution from AI Assistant through AI Creative Copilot to AI Production Operating System.

29. One-Page Strategy Summary

Dimension	Tattava Strategy
Vision	AI-native operating system for entertainment development and production

Dimension	Tattava Strategy
V1 Wedge	Story Development Copilot
Core user	Writers, story developers, creative producers, directors
Core problem	Fragmented context, research, creative development and continuity
Core value	Faster development with persistent project intelligence
AI-native differentiator	AI reasons over persistent project state rather than isolated prompts
Core intelligence asset	Story Brain / Project Intelligence Layer
Trust mechanism	Human approval + source traceability + canon
Strategic moat hypothesis	Project intelligence + cross-stage continuity + decision/dependency intelligence
Market position	Above individual AI generation tools and alongside/integrating with production systems
Business model now	Internal strategic capability
Long-term model	Unified entertainment operating system
North Star	Time and complexity from idea → production-ready execution
V1 success	Idea → approved, researched, structured story package
Long-term success	One project intelligence layer across creative + production lifecycle

The Tattava's immediate scope as V1 Story Development Copilot and its longer-term goal as moving a project from idea through production, final film and distribution.

The most important strategic decision

Do not build V1 as "15 AI features."

Build V1 as **one intelligent project-development system** whose capabilities reinforce each other:

**Project → Story Brain → Research → Reasoning → Story → Writing →
Screenplay → Dialogue → Canon → Evaluation → Approved Package**

If this loop works exceptionally well, **V2, V3, V4 and the production OS become extensions of the same intelligence layer rather than separate products.**

That is the strategic architecture that makes the Tattava vision coherent.
